

Micro-Feeding For Outstanding Results!

Like having a Full Time Gardener ...

An EZ-FLO system carefully feeds the entire landscape just like a full time gardener would do, caring for the soil and all the plant life. EZ-FLO feeds gently, in **small “micro-doses”**, with each watering, giving the plants a healthier root system that makes them stronger and more drought-tolerant. Young landscapes mature more quickly and a healthy landscape can resist attacks by insects and weeds. Your landscape has a consistent look without the stress of surge growth!

Superior to traditional granular fertilizing methods

The EZ-FLO system eliminates exposure to harmful chemicals. EZ-FLO recommends only non-hazardous products and the system applies them in trace amounts that can be within increasingly restrictive government guidelines. By applying water soluble or liquid products in small “micro-doses” every time your irrigation system waters, they are almost fully absorbed by the plant eliminating harmful leaching or fertilizer runoff. Healthier plants mean fewer weeds and less insect activity, dramatically reducing the need for pesticides and herbicides.

EZ-FLO is simple and trouble-free

Before

After 1 Year

EZ-FLO eliminates the complexities and expense that have made fertigation an impractical option for residential landscapes. Simply fill the system every 4 to 6 weeks and the rest is automatic. Our systems have **no moving parts, no electrical connections and require no programming or ongoing maintenance.**

EZ-FLO frees up time to enjoy your beautiful landscape.
